

Capture Current Addresses

Local Address Collection is a program customization that allows students to verify their local address when logging into WebAdvisor. After the user ID and password are validated, a process is called to determine if the student should verify their local address. There are four possible scenarios:

- The person logging in is not a student, or the student does not fall into the category of students who are required to verify their local address. In this case the user is taken directly to the main WebAdvisor menu.
- The person logging in is a student who should verify their local address, and the last verification was performed less than a year ago. The student is taken directly to the main WebAdvisor menu.
- The person logging in is a student who should verify their local address, and the last verification was performed over a year ago. The student is taken to a form to verify their address.
- The person logging in is a student who should verify their local address, and no local address exists. The student is taken to a form to enter a local address.

This process keeps records current which eliminates incomplete demographic information that can severely hamper effective outreach to students.
